

## No poverty

- Poverty
  - Problem: Not having enough money to be able to get enough Food, Water, or a place to live
  - Goal: Make sure everyone has enough money to get things like food, water, shelter
    - How do people get money? A job
      - Making sure everyone has an equal chance to get a job so they can buy food, water, and have a place to live

## Zero Hunger

- Problem: Not everyone has enough food. This leads to something called malnutrition
  - Malnutrition means you are not getting enough vitamins– the things that help us grow
- Problem(continued): If someone is malnourished, they can't grow to be big and strong
- Goal: Make sure enough, and different kinds of food, are available for everyone so they get enough vitamins to grow big and strong

## Good health and wellbeing

- Problem: People can get sick, but not everyone can afford to go to the doctor if they become sick
  - Goal: making sure things like medicine and vaccines are easy to get and they are affordable

## Quality Education

- Problem: Not everyone gets to go to school
- Goal: Make sure schools are SAFE (we can't learn if we don't feel safe), easy to enroll

- Employing more teachers can make education/school means more people can go to school and become educated

### Gender Equality

- Problem: In many places women's rights and opportunities are not the same as men's
  - Goal: Make the same rights and opportunities for women and men
    - What kind of opportunities?
      - Voting
      - Deciding what they can do with their bodies (if they want to have children, or not)
      - Being able to represent their community in government if they want to (so they can help make decisions for their community)

### Clean Water and Sanitation

- Problem: Not everyone has clean water. We don't only need water to drink, but to take showers and keep clean so that we are healthy
- Goal: make sure there are ways for everyone to get clean drinking and bathing water

### Affordable and Clean Energy

- Problem: There are a lot of different types of energy (burning wood/coal, electricity, gas, sunlight, flowing rivers, wind)
  - We all need energy to make sure we can get to work and school; to keep the lights on; make sure

there is running water for drinking, bathing, plumbing

- The types of energy like solar, wind, flowing rivers help are planet stay healthy
  - Goal: to make these types of energy easy to use and so that everyone can use them. If we use more of those types of “clean” energy to keep our planet healthy for longer

### Climate Action

- Problem: the types of energy like gas, burning coal, and wood give out Co2 witch makes our planet's temperature rise
  - When temperatures rise, it is harder for animals and humans to live they way they have been
    - Ex think about what ice does when it gets hot (melts) animals like polar bears and penguins live on ice. If it melts, where are they going to live
  - Goal: To use less of the energy that puts CO2 into our air, to slow the earth’s rising temperature

### Life Below Water

- Problem: There are lots of plastic and trash that end up in our oceans because people litter. The sea life thinks this is food, but it is not; they eat the trash and plastic and get sick and die
- Goal: use less plastic and do not litter

### Life on Land

- Problem: Some people want to chop down trees and clear forests to make more room for cities. This means

that the animals that live in these places will no longer have a home, and will likely die

- Goal: protect forests where animals live from being chopped down so they can stay in their homes
